COMP0137: MACHINE VISION Table of Contents

- **2: Intro to Probability:**
    - Joint probability
    - Conditional, Independence
    - Bayes Rule, Expectation
- **3: Probability Distributions:**
    - distributions and their conjugate
    - importance of conjugate relation
- **4: Fitting probability distributions:**
    - Maximum Likelihood
    - Maximum A Posteriori
    - Bayesian approach
- **5: The Normal Distribution:**
    - Univariate
    - Multivariate
    - types of covariance
    - marginal distributions
    - conditional distributions
    - product of 2 normals
    - changing of variables
- **6: Learning and Inference:**
    - Discriminative model
    - Generative models
    - For Regression
    - For Classification
    - How should we choose?
- **7: Modelling Complex Densities:**
    - Models with hidden variables:
        - § Mixture of Gaussian, Student t-distribution, Factor analysis

- Combining models
- Expectation Maximisation (EM) algorithm: its bound
- Kullback-Leibler Divergence

· **8: Regression:**
- Linear/Non-linear regression
- Kernerlisation (kernel trick) and Gaussian Process
- Sparse linear regression
- Dual linear regression
- Relevance vector regression

· **9: Classification:**
- Logistic regression
- Bayesian logistic regression
- Non-linear logistic regression
- Kernelization and Gaussian process for classification
- Incrimental fitting
- Bagging and Boosting
- Multi-class classification
- Random classification trees
- Non-probabilistic classification

· **10: Graphical models:**
- Directed/Undirected Graphs
- Markov blanket
- Clique
- Gibbs Sampling
- Contrastive Divergence

· **11: Models for Chain and Trees:**
- Chain and tree models (using graphical models to model our MV problem)
- MAP solution of the 2 models
    § Hidden Markov
- Maximum marginals of the 2 models

§ Forward-Backward algo, factor graphs, Sum-Product algo

- o Models with loops

    § Loopy Belief Propagation

- · **12: Models for Grids:**

    - o Denoising problem
    - o Markov Random Fields (MRF)
    - o Smoothing problem, Graph Cuts
    - o Max-Flow problem
    - o Min-cut problem
    - o Binary MRFs – submodular
    - o Multilabels MRFs – submodular
    - o Multilabels MRFs - non submodular

        § Alpha expansion algo

- · **13: Preprocessing techniques:**

    - o Per-pixel transformation (texton, gradient, gabor filters)
    - o Detecting edges, corners and interest points
    - o Descriptors

        § Bag-of-words

    - o Dimensionality Reduction:

        § Least Squares Criterion

        § PCA

        § K-mean algo

- · **14: Pinhole camera:**

    - o Homogeneous coordinates
    - o Learning parameters:

        § Intrinsic (Calibration)

        § Extrinsic (Exterior orientation)

        § Inferring 3D points of pinhole (3D reconstruction)

- · **15: Transformation models:**

    - o Homography

- o Learning intrinsic, extrinsic, inferring 3D points of transformation models with homographies
- o Robust estimation of transformations
  - § RANSAC

· **16: Multiple Cameras:**
  - o Camera motion detection: two-view geometry (epipole)
  - o Essential Matrix
  - o Fundamental Matrix
  - o 8 point algo
  - o two-view reconstruction
  - o dense reconstruction
  - o planar rectification
  - o bundle adjustment

· **17: Modelling shapes:**
  - o snakes outline
  - o shape template model
  - o statistical shape models
  - o probabilistic principal components analysis (PPCA)
  - o Gaussian process latent variable model (GPLVM)
  - o articulated models (aka kinematic chain)

· **19: Temporal models:**
  - o Extended Kalman filters
  - o Unscented Kalman filters
  - o Particle filters
  - o Condensation algo

· **N: Neural Nets Basic:**
  - o Feed-forward net
  - o Types of layers
  - o Training using backpropagation
  - o Stochastic gradient descent
  - o Fine-tuning a pre-trained network

- o Auto-enconders
- o Practicalities
- · **N+1: Neural Nets architecture:**
  - o Convolutional NN
  - o Network design choices
  - o Regularization and Optimization
  - o Network architectures
  - o Practicalities
